ExpEcon Methods:
Empirical Tests of Incentive Compatibility

ECON 8877
P.J. Healy

Testing IC vs. Framing Effects

A test of IC? (Cox Sadiraj & Schmidt 2014)

	D_1	D_2
Treatment 1:	$\{\$4, (\frac{1}{2}, \$10)\}$	
Treatment 2:	$\{\$4, (\frac{1}{2}, \$10)\}$	$\{\$3, (\frac{1}{2}, \$12)\}$

If we observe differences on D_1, it could be

- the mechanism was not IC, or
- the presence of D_2 altered preferences (e.g., decoy effect).

Other papers that use this method:

- Cubitt Starmer Sugden (1998 Exp.1)
- Beattie & Loomes (1997)
- Cubitt Starmer Sugden (1998 Exp.2)
- Harrison & Swarthout (2014)
- Cox Sadiraj & Schmidt (2015)

Replace Treatment 1 with a "Framed Control" treatment:

	D_1	D_2	Mechanism
Treatment 1:	$\{\$4, (\frac{1}{2}, \$10)\}$	$\{\$3, (\frac{1}{2}, \$12)\}$	Pay only D_1
Treatment 2:	$\{\$4, (\frac{1}{2}, \$10)\}$	$\{\$3, (\frac{1}{2}, \$12)\}$	RPS

LESSON: Proper test of IC must show all subjects same choices.

Cox, Sadiraj & Schmidt (2015)

Test various payment mechanisms in lottery choice setting

1. Pay All (PA)
   - PAS: Sequentially (learn outcome each period)
   - PAI: Independently at the end
2. Pay One Randomly (POR)
   2.1 PORpi: with prior info about all choices to be made
   2.2 PORnp: no info about upcoming choices
   2.3 PORpas: learn realized payoffs you go, then get 1 at the end
3. Pay All Correlated (PAC) (lotteries must have same state space)
   - PAC/N divides payoffs by # of decisions, to match POR
4. One Task (OT)
   4.1 ImpureOT: Make all choices, but only one is paid
      - Added by a referee (not me!) and reported separately

Cox, Sadiraj & Schmidt (2015)

Design:

- Choice over 5 lottery pairs
- Testing various versions of Allais paradox
- OT: between-subjects. All others: within-subject
    - Therefore OT Allais paradoxes are between-subject via Probit
- Choices on 5 separate slips of paper in an envelope

Analyses:

- Probit on Pr(Allais paradox) including demographics, EV, etc.
- Choice frequencies
- Probit on choice frequencies

Table 3 Test results for Hypotheses 1–4

Mechanism	CRE	CCE	DCRE	DCCE
OT	No	No	No	Yes[e]
PORnp	No	No	No	No
PORpi	No	Yes[b]	Yes[c]	No
PORpas	Yes[a]	No	No	No
PAS	No	Yes[b]	No	No
PAI	Yes[a]	No	No	No
PAC/N	No	Yes[b]	No	No
PAC	Yes[a]	No	Yes[d]	No

Notes: [a]Fan Out; [b]Fan In; [c]IRRA; [d]DRRA; [e]IARA

Can't really compare cleanly to OT
But, definite differences across mechanisms
And whether they see the questions in advance or not!

Table 4 Observed frequencies (in %) of choices of less risky options (low and high column figures in bold)

Mechanism	S_1	S_2	S_3	S_4	S_5	All Pairs [95 % CI]
OT (231 subjects)	**39.47**	**15.52**	27.59	28.95	38.46	28.60 [22.7, 34.4]
PORnp (40 subjects)	37.50	45.00	**47.50**	32.50	**60.00**	44.50 [37.6, 51.4]
PORpi (40 subjects)	27.50	50.00	42.50	22.50	50.00	38.50 [31.7, 45.3]
PORpas (40 subjects)	**22.50**	42.50	**20.00**	**10.00**	30.00	25.00 [18.9, 31.1]
PAS (39 subjects)	25.64	23.08	33.33	10.26	**17.95**	22.10 [16.2, 27.9]
PAC (38 subjects)	36.84	**52.63**	23.68	21.05	42.11	35.30 [28.4, 42.1]
PAC/N (40 subjects)	37.50	35.00	35.00	22.50	45.00	35.00 [28.3, 41.7]
PAI (38 subjects)	36.84	**52.63**	36.84	**34.21**	52.63	42.60 [35.5, 49.7]

All Pairs: % who chose safe in all 5 Most risk averse: PORnp and PAI
Least risk averse: PORpas and PAS

Cox, Sadiraj & Schmidt (2015)

What about Impure OT?

- Paper only compares Impure OT to OT
  - More risky choices under Impure OT
  - Framing effect exists!
- But we want Impure OT vs. each mechanism!
- Probit Pr(Safe) results:
  - PORnp, PORpi, and PAI are different from ImpureOT
- But, looking at the actual choice data task-by-task, I don't find significant differences...

Starmer & Sugden (1991)

- 22 binary lottery choice questions. $n = 40$ per treatment
- First 20: hypothetical (piloting for another study)
- Questions 21 and 22: RPS vs. only one paid. Same page.
- Allais paradox questions.

TABLE 1—THE DESIGN OF THE EXPERIMENT

Group	Question 21	Question 22	Incentive
A	P′	P″	P″ is for real
B	P′	P″	Each problem has 0.5 chance of being for real
C	P″	P′	Each problem has 0.5 chance of being for real
D	P″	P′	P′ is for real

A vs. B: $p = 0.356$ (my calculation)
C vs. D: $p = 0.043$ (my calculation)

Cubitt Starmer & Sugden (1998)

- Five binary menus of lotteries
- Experiment 1 ($n = 201$)
    - Group 1.1: RPS: $(1/3, D_3; 2/3, D_4)$
    - Group 1.2: RPS: $(1/3, D_3; 2/3, D_5)$
    - (Two other groups to test IND and ROCL)
    - Use D_3 to test IC. No differences.
- Experiment 3 ($n = 202$)
    - 3.1: 20 decisions, 1st is paid
    - 3.2: 20 decisions, 2nd is paid
    - 3.3: 20 decisions, RPS on all 20
    - 3.4: Same as 3.3 but with lower stakes
    - 3.1 D_1 vs 3.3 D_1: $p = 0.685$
    - 3.2 D_2 vs 3.3 D_2: $p = 0.120$

Table 9

Existing tests of incentive compatibility of the RPS mechanism that have no framing confounds. We describe each of these comparisons in the text below.
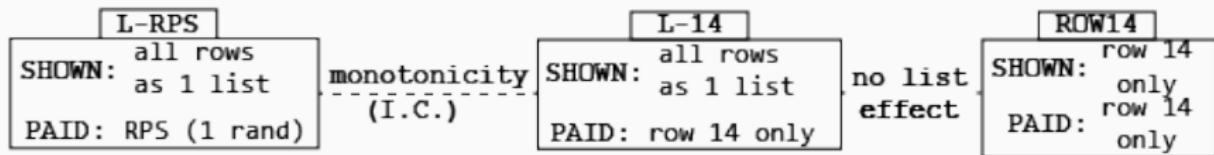

Paper	Names of treatments		p-Value	RPS is I.C.?
Starmer and Sudden (1991)	A vs. B		0.356	✓
Starmer and Sudden (1991)	C vs. D		**0.043**	×
Cubitt et al. (1998)	3.1 vs. 3.3		0.685	✓
Cubitt et al. (1998)	3.2 vs. 3.3		0.120	✓
Cox et al. (2014b)	PORpi vs. ImpureOT2		0.122	✓
Cox et al. (2014b)	PORpi vs. ImpureOT3		0.988	✓
Cox et al. (2014b)	PORpi vs. ImpureOT4		0.397	✓

Brown & Healy (2018)

| Row #	Option A		or	Option B	
1	Balls 1-10 pay $10 (50% chance of $10)	Balls 11-20 pay $5 (50% chance of $5)	or	Ball 1 pays $15 (5% chance of $15)	Balls 2-20 pay $0 (95% chance of $0)
2	Balls 1-10 pay $10 (50% chance of $10)	Balls 11-20 pay $5 (50% chance of $5)	or	Balls 1-2 pay $15 (10% chance of $15)	Balls 3-20 pay $0 (90% chance of $0)
3	Balls 1-10 pay $10 (50% chance of $10)	Balls 11-20 pay $5 (50% chance of $5)	or	Balls 1-3 pay $15 (15% chance of $15)	Balls 4-20 pay $0 (85% chance of $0)
4	Balls 1-10 pay $10 (50% chance of $10)	Balls 11-20 pay $5 (50% chance of $5)	or	Balls 1-4 pay $15 (20% chance of $15)	Balls 5-20 pay $0 (80% chance of $0)
	Balls 1-10 pay $10 (50% chance of $10)	Balls 11-20 pay $5		Balls 1-5 pay $15	Balls 6-20 pay $0
⋮	⋮	⋮		⋮	⋮
18	(50% chance of $10)	(50% chance of $5)	or	(90% chance of $15)	(10% chance of $0)
19	Balls 1-10 pay $10 (50% chance of $10)	Balls 11-20 pay $5 (50% chance of $5)	or	Balls 1-19 pay $15 (95% chance of $15)	Ball 20 pays $0 (5% chance of $0)
20	Balls 1-10 pay $10 (50% chance of $10)	Balls 11-20 pay $5 (50% chance of $5)	or	All Balls pay $15 (100% chance of $15)	(0% chance of $0)

Click Here When Finished
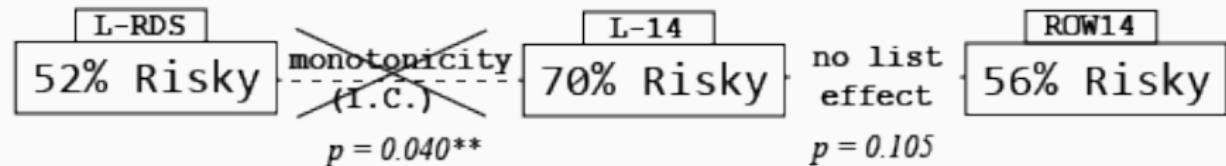

Our Design

- Andreoni-Sprenger formatting
- Standard Ohio State subject pool.
- Between-subjects.
- Computerized.
    - List format: rows must be answered sequentially.
- Physical randomizing devices (die, bingo cage)
- No other tasks in the experiment.
- 60–63 subjects per treatment.
- Question: Do Row 14 choices differ by treatment?

Row 14:

- Using RPS mechanism makes them switch later.
  (More thoughtful? Switching inertia?)
    - Statistically significant.
- Showing whole list makes them switcher earlier
  (Closer to the middle.)
    - Not quite significant.
- The two effects nearly offset

14

Hypothesis
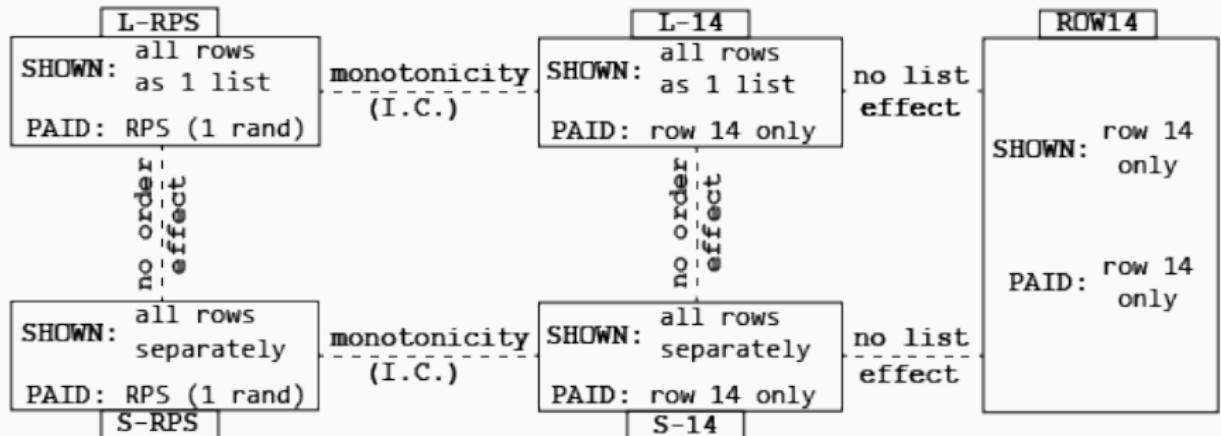

- Subjects are combining the decisions in a reduction-like way.
  E.g.: 'When to switch?'.
- The 'combining' can be broken by separating the decisions.

New Treatments
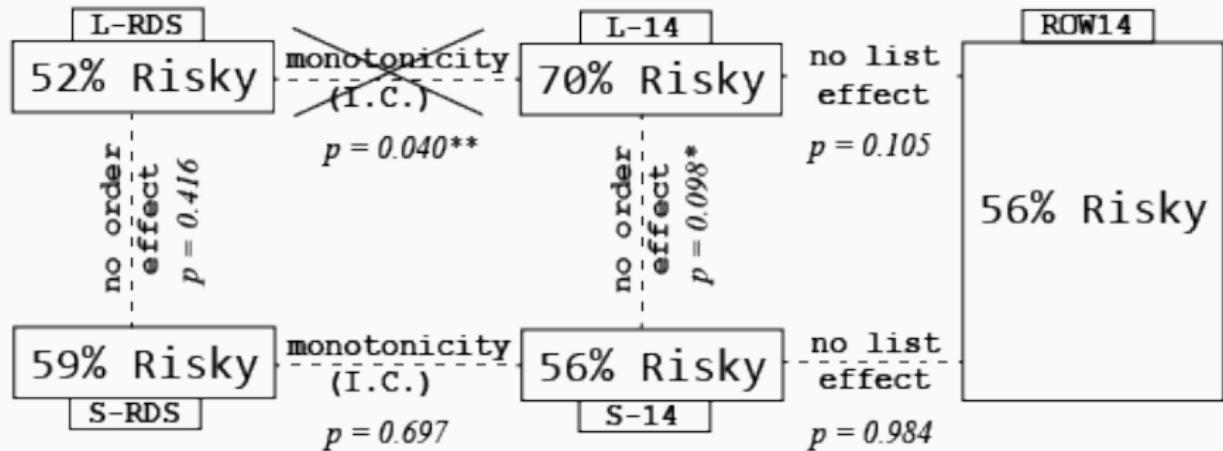

'Separated' treatments.

- Same 20 rows.
- Each shown on separate screen.
- Order of rows randomized for each subject.
- Still comparing RPS to Pay-14-Only.
- Still must answer every row, in order given.
    - First attempt: on paper. They shirked.
    - Second attempt: computerized, forced answers
- Still 60–63 observations per cell, between subjects.

```
        L-RPS                              L-14                         ROW14
 ┌──────────────────┐              ┌──────────────────┐          ┌──────────────────┐
 │ SHOWN: all rows  │ monotonicity │ SHOWN: all rows  │ no list  │                  │
 │        as 1 list │   (I.C.)     │        as 1 list │ effect   │                  │
 │                  │              │                  │          │ SHOWN: row 14    │

 │                  │              │                  │          │                  │
 │ PAID: RPS (1 rand)│             │ PAID: row 14 only │          │                  │
 └──────────────────┘              └──────────────────┘          └──────────────────┘
        S-RPS                              S-14
```

17
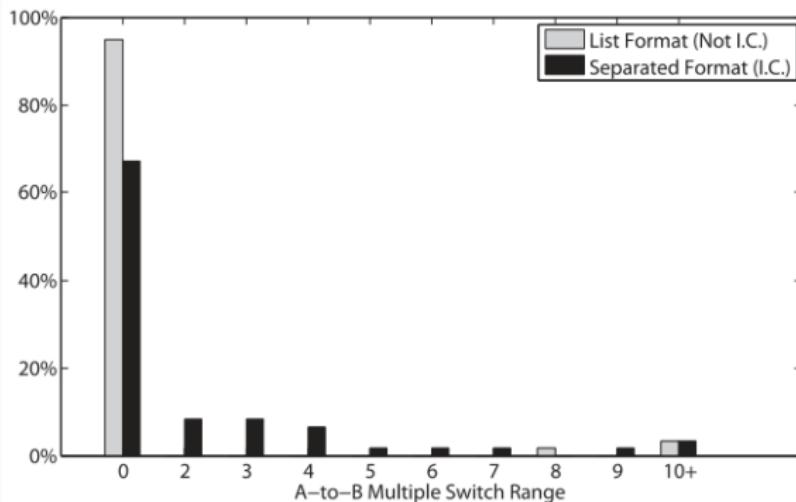

B-to-A (Risky-to-Safe) switches violate FOSD:
$Risky_{15}$ dominates $Risky_{14}$, but $Risky_{14} \succ Safe \succ Risky_{15}$
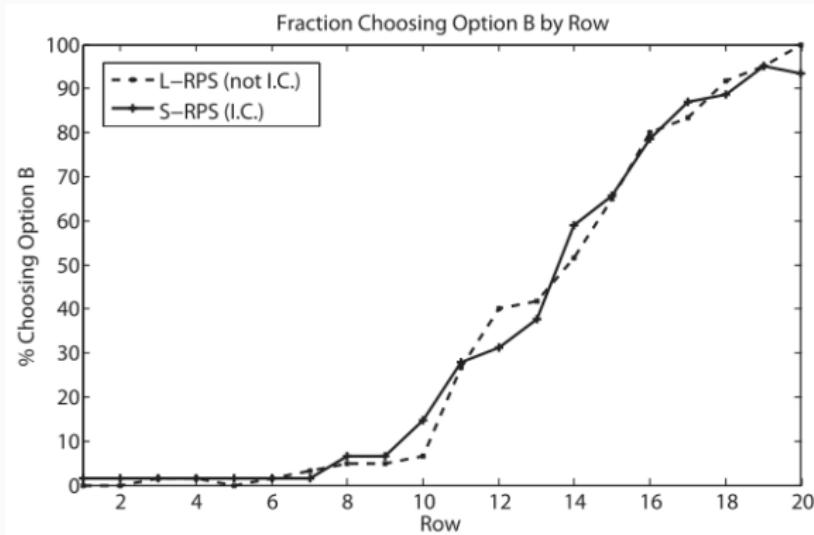

LESSON: Separating decisions hurts consistency? NO!
The list format generates *false consistency*!

Biases Cancel Out

Fraction Choosing Option B by Row

L-RPS was fine because "list effect" and "IC failure" canceled out!
I wouldn't expect that to be true generally...

Table 9
Existing tests of incentive compatibility of the RPS mechanism that have no framing confounds. We describe each of these comparisons in the text below.

Paper	Names of treatments	Presentation format	p-Value	RPS is I.C.?
Starmer and Sugden (1991)	A vs. B	List	0.356	✓
Starmer and Sugden (1991)	C vs. D	List	**0.043**	✗
This paper	L-RPS vs. L-14	List	**0.041**	✗
This paper	S-RPS vs. S-14	Separated	0.697	✓
Cubitt et al. (1998)	3.1 vs. 3.3	Separated	0.685	✓
Cubitt et al. (1998)	3.2 vs. 3.3	Separated	0.120	✓
Cox et al. (2014b)	PORpi vs. ImpureOT2	Separated[a]	0.122	✓
Cox et al. (2014b)	PORpi vs. ImpureOT3	Separated[a]	0.988	✓
Cox et al. (2014b)	PORpi vs. ImpureOT4	Separated[a]	0.397	✓

[a] Cox et al. (2014b) give subjects the choices on separate slips of paper, but the subjects could have arranged them into a list-like format if they wanted.

Other Discussion of Separation
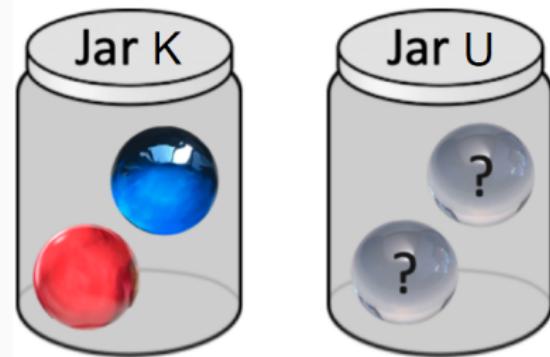

1. Kirby & Marakovic (1996) and Kirby et al. (1999)
   - Use scrambled lists in a field setting, including heroin addicts
2. Eckel et al. (2005)
   - Use scrambled with working poor
   - "we now believe that scrambling is a bad idea because it results in greater inconsistency and variance of responses."

RPS for Hedging Ambiguity?

Is RPS used to hedge ambiguity?

- Oechssler Rau & Roomets (2019): No
  - Issues with their design
- Baillon Halevy & Li (2022)...

D_1:	K = $2.00 if red from K
	U = $2.10 if red from U
D_2:	K = $2.00 if blue from K
	U = $2.10 if blue from U
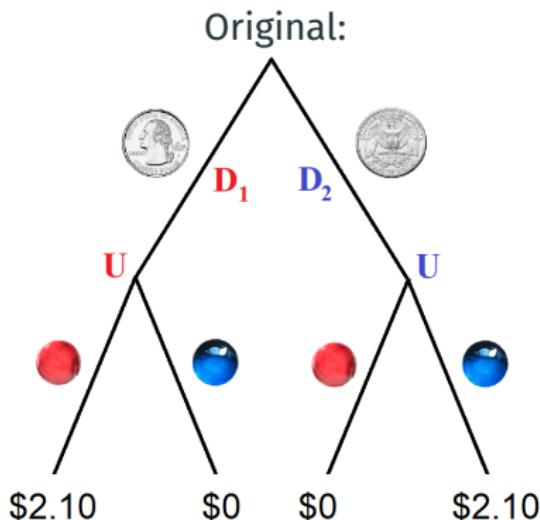

One paid randomly via coin flip

Pr(Red in U)≈Pr(Blue in U) & Ambiguity Averse: K ≻ U and K ≻ U.
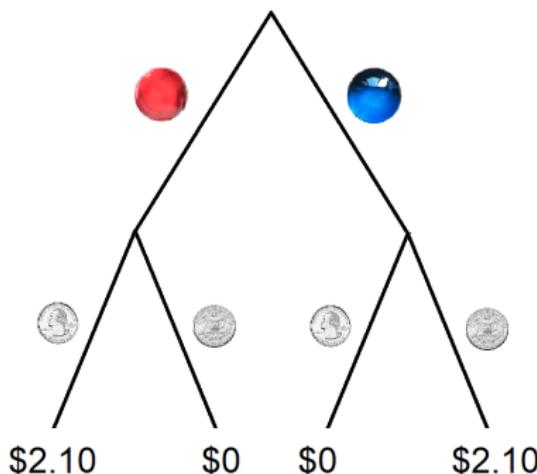

Raiffa (1961): Picking UU "hedges away" the ambiguity! UU ≻ KK
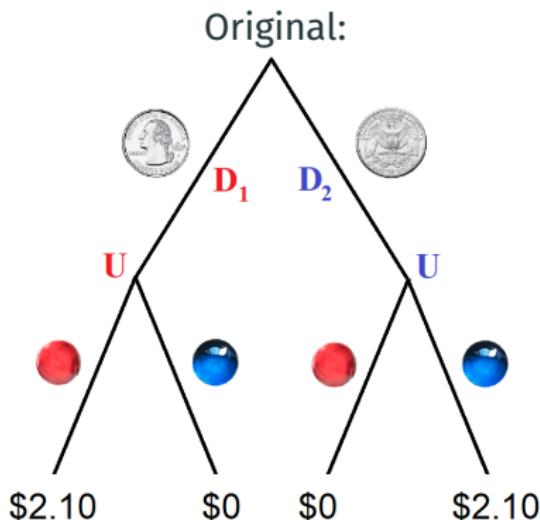

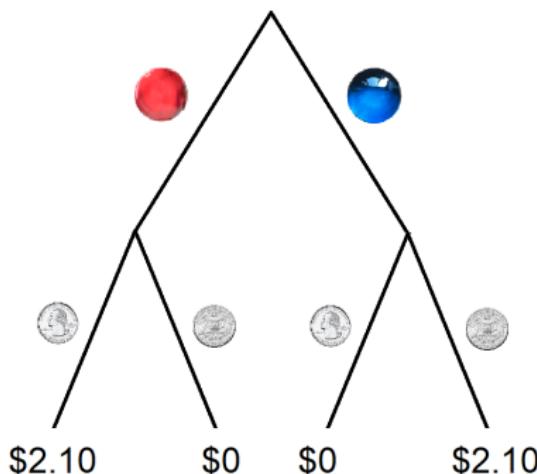

Picking UU:

Original:

D_1 D_2

U U

$2.10 $0 $0 $2.10

Ambiguity:
KK ≻ UU

Order-Reversed:

$2.10 $0 $0 $2.10

50-50 Lottery For Sure
UU ≻ KK

Picking UU:

Original:

D_1 D_2

U U

$2.10 $0 $0 $2.10

Ambiguity:

KK ≻ UU

Order-Reversed:

$2.10 $0 $0 $2.10

50-50 Lottery For Sure

UU ≻ KK

Assumption: Order Reversal

Past Experiments

Order reversal has support...

- Coin before $\sim$ Coin after
    - Oechssler, Rau & Roomets (2019; ORR19)
    - Baillon, Halevy & Li (2022)

...yet people don't seem to appreciate hedging:

- Raiffa (1961), Dominiak & Schnedler (2011)
    - Ambiguity averse subjects don't value UU more than U and U
- ORR19 find mixed evidence for hedging
    - Amb. Averse & Pr(blue)≈Pr(red) Subjects:
        - 50% consistent with hedging (or randomization)
   - Issues: Indifference & Cross-task contamination

Baillon, Halevy & Li (2022) (BHL22):
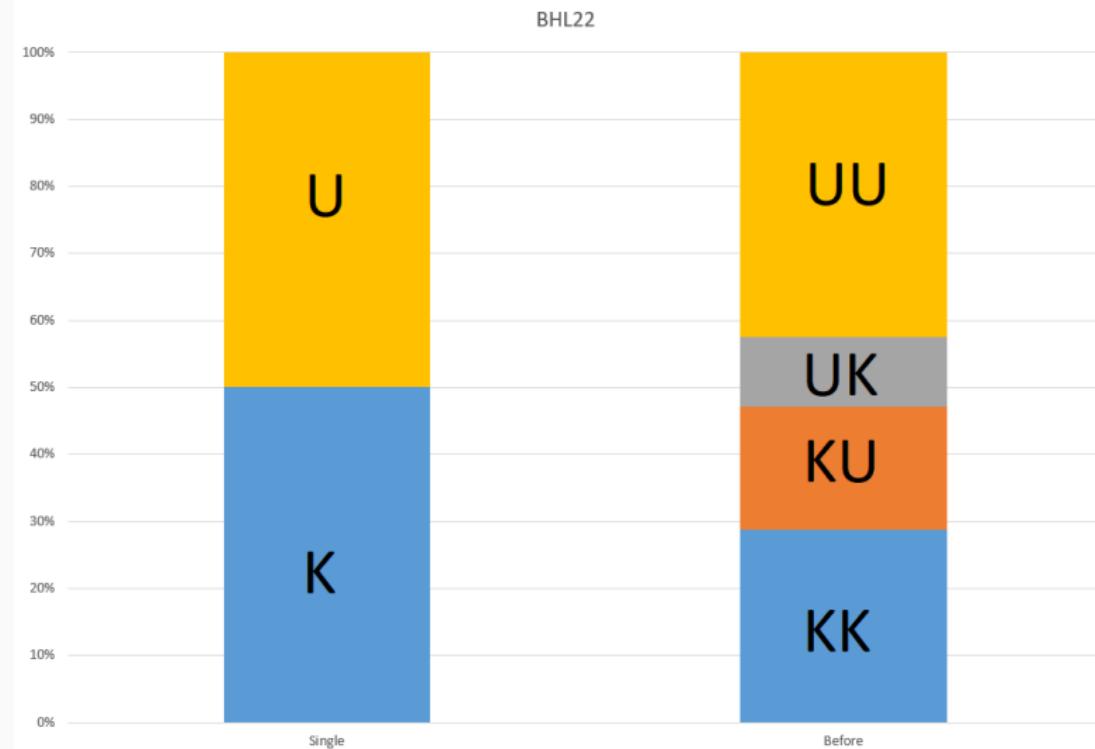

- "Single" Treatment:
    - $D_0 = \{$K,K,U,U$\}$
    - U or U $\Rightarrow$ Ambiguity neutral/loving *or* Pr(red)$\gtrsim$Pr(blue)
    - K or K $\Rightarrow$ Strictly ambiguity averse *and* Pr(red)$\approx$Pr(blue)
    - 50% choose K or K
      $\Rightarrow$ 50% are Amb. Averse *and* Pr(red)$\approx$Pr(blue)
        this is a *lower bound* on Amb. Aversion
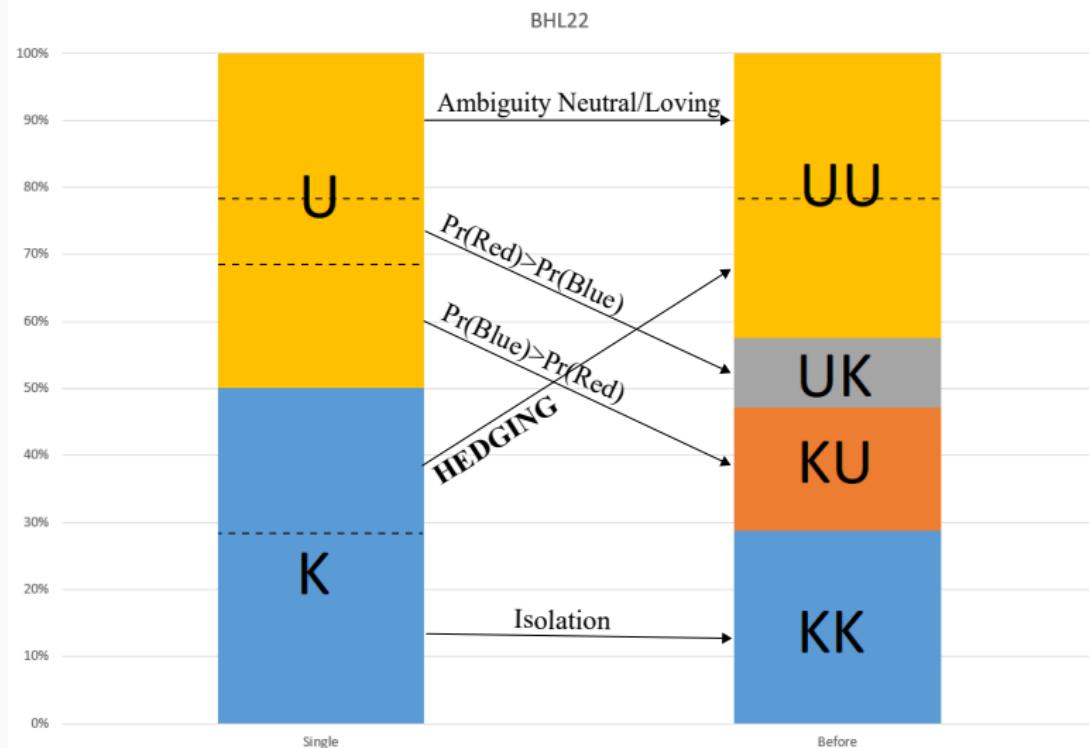

- "Before" Treatment:
    - $D_1 = \{$K,U$\}$, $D_2 = \{$K,U$\}$, coin flip **first**
    - What will Amb. Averse subjects pick?
        - Order Reversal + Hedging $\Rightarrow$ UU
        - "Isolation" $\Rightarrow$ KK
        - Pr(red)$\gtrsim$Pr(blue) $\Rightarrow$ UK or KU
          (uses Azrieli et al. 2018, ignoring stochastic choice)

27
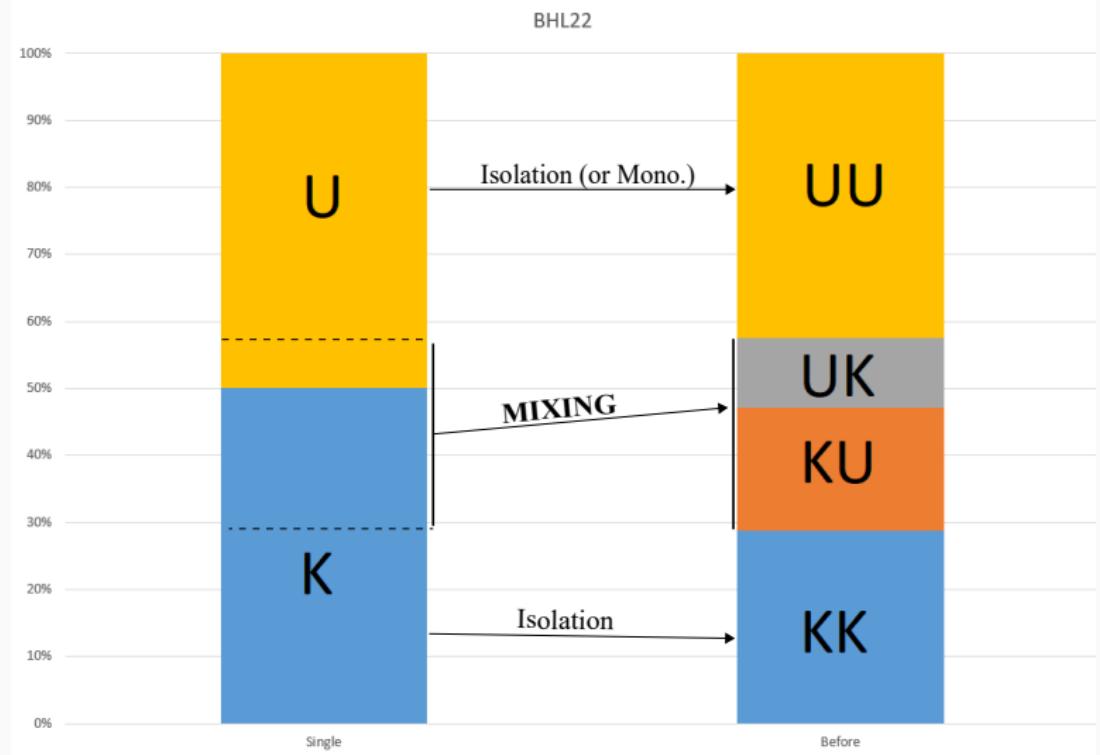

Is it necessarily hedging?

Pay All

Susan Laury's paper...

Summary

- Theory: RPS generally fine *unless* subjects "reduce" (treat the experiment as one large decision)
- List format seems to encourage reduction, IC violations
- Separated format breaks reduction, restores IC
    - Separated *and* random order. Haven't tested which.
- List format generates *false consistency*
- Ambiguity:
    - RPS is not IC!
    - But is it really hedging??
